

Room Profile

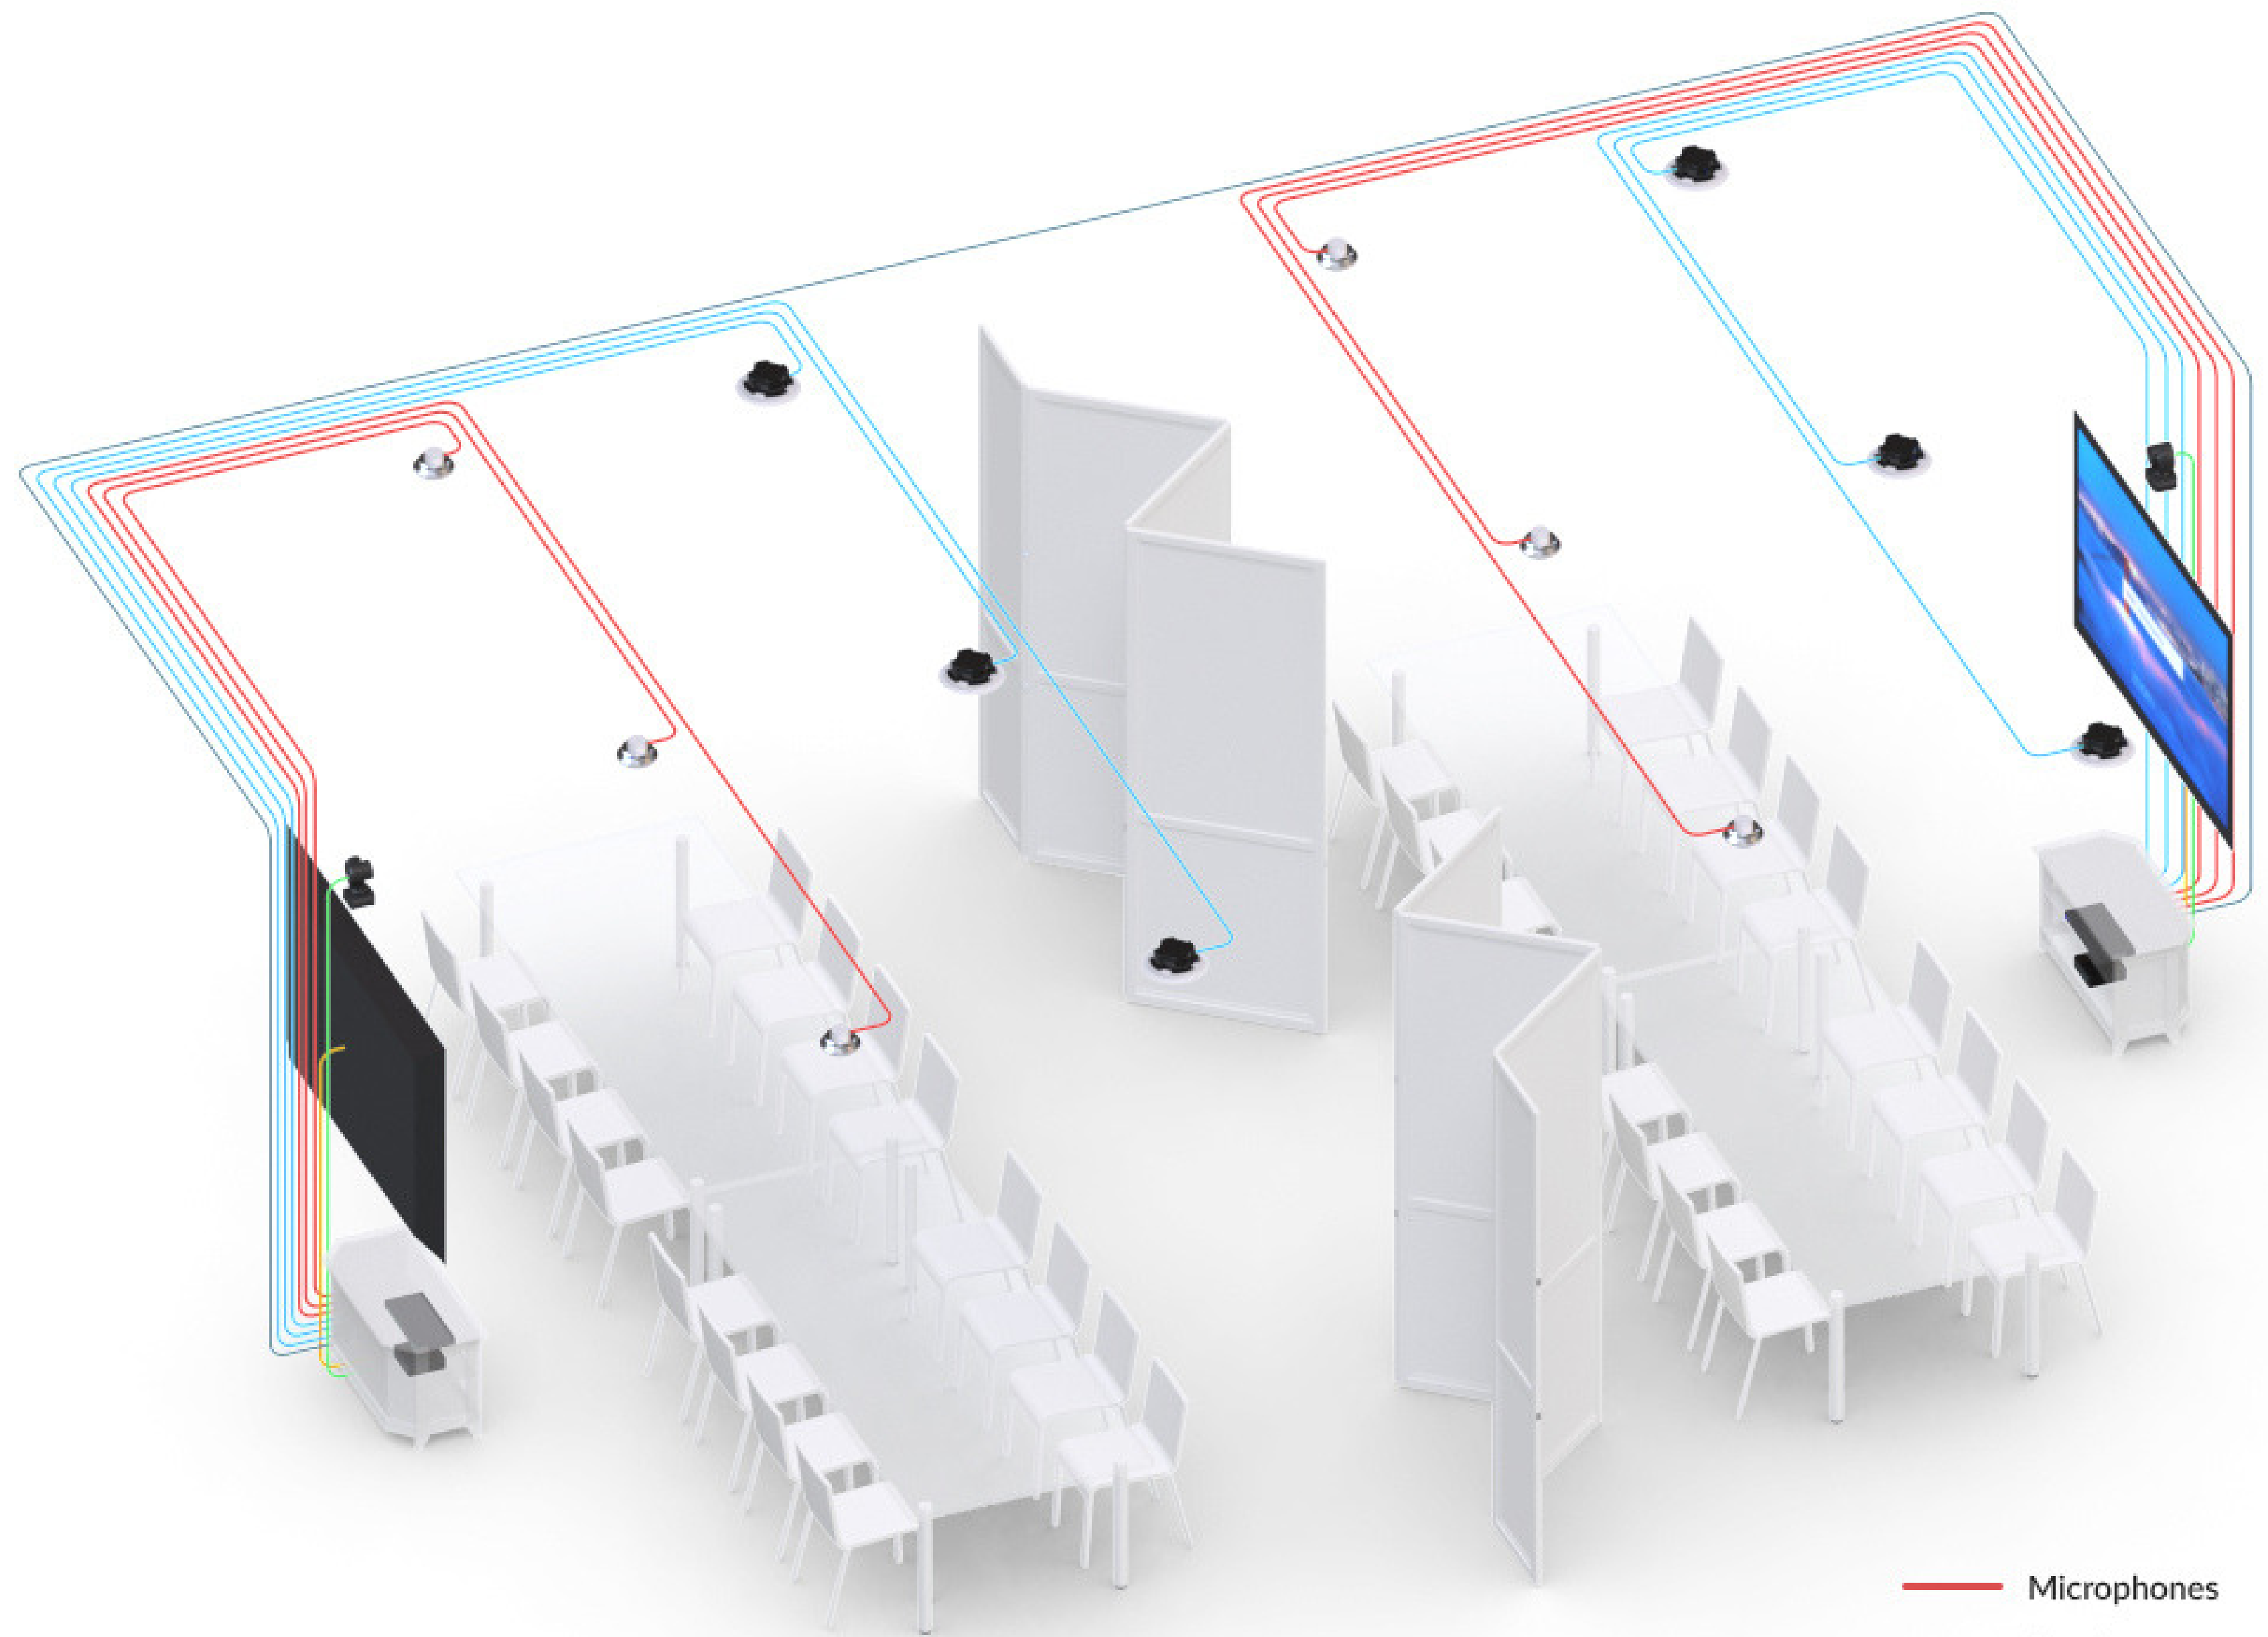

Flex Room

Variable-Sized Conference Flex Rooms are becoming more popular in the professional workspace, creating the flexibility to shrink, divide, and partition off certain areas to fit the need of each meeting. To fully take advantage of this flexibility, the hardware must be just as flexible. The Phoenix Audio Stingray (MT700) – Distributed Array Mixer and our proprietary daisy-chaining technology provides the flexibility to adapt to this changing space.

In the following rendering, we created a large room that seats up to 32 people and utilizes two **MT700 Stingray DSPs** daisy-chained together. This offers a flexible solution that enables you to adjust audio coverage to match the configuration of your variable-sized conference Flex Room, without rewiring or re-configuring the existing audio equipment in place.
